Unofficial English translation of the application

A

The bottlebag made of thermoplastic film material has the disadvantageous characteristic that its inner sides stick together, which when cleaning and filling the bag is considerably displeasing as the inner sides must be manually and circumstantially separated from each other.

B

The object of the present invention is to permanently prevent, fully or to a large extent, that the inner sides of the walls of the bottlebag adhesively stick together by suitable treatment of the inner sides.

Claim 1

Bottlebag of thermoplastic film material for biological or therapeutic fluids, characterized in that to prevent adhesive sticking together of the inner sides, at least one of the two container walls, fully or partly, permanently is provided with a surface structure profiled with elevations and/or recesses.
